

# Excavator Full Length Rock Guards

Rock guards protect the track rollers of your excavator by guarding them from debris, rocks, and other foreign materials. The use of rock guards will extend the life of your undercarriage.

Standard Rock Guards

- Can be installed on machine without removing tracks
- Built with heavy duty formed shoes.
- For easier install and alignment purposes, the shoes bolt up to the track frame prior to welding.
- Rock guards come with heavy duty bolts and spacers.

HNL offers two styles of rock guards:

1. Standard Rock Guards - used and suitable for most conditions.
2. Flotation Rock Guards - designed for extreme conditions, including steep or uneven terrain. These rock guards offer better stability and help prevent twisting of the rails.

Flotation Rock Guards

*\*Specifications subject to change without notice.*

*\*\*Machine or guarding items may require minor alterations during install.*
